

A SHORT INTRODUCTION

Readers are invited to the first (introductory) chapter of the book "Spectral Colour Flows of Time", which tells about Time as a life-giving force that continuously creates different worlds, including our World of Living Life. Time has a fractal structure embracing Infinity, where each fragment of the Fractal "Infinity" manifests itself in the form of any structure of the material world that we accept as the only "real" one. Fragments of the Fractal "Infinity" are interconnected by the streams of the colored currents of the times that constitute the One Time of Infinity. Each structure has its own frequency range, continuously vibrating, interacting with other structures. The range of each structure, including, and each part of it, forms a spectrum. The spectral flows of the non-material (energy) world form the Time of Infinity. The physical body of each structure of the material world is the place of maximum compaction of spectral flows. Each structure, including man, is the body + consciousness, where the body belongs to the material world, and consciousness — to the non-material (energetic world). This means that expanding the range of consciousness will expand the physical capabilities of the material body. Because Time is a fractal, Everything consists of Everything and Everything is contained in Everything. Therefore, Time controls all events of the material (physical) world. It is Time that affects the consciousness of people in such a way that some of them begin to hear his call and respond to him.

In the first chapter, it will be about such people — independent researchers of time — whose work will help us learn a different view of the world around us, in particular, feel like an integral part of it. It's no secret that on the planet some periods were replaced by others. And our piece of Time is no exception. The Earth not only rotates around the Sun at a speed of 30 km/sec, it flies in the Galaxy with the Sun at a speed of 250 km/sec, which is more significant. A galaxy is not nearly an "empty" space, including remote stars. The galaxy is a living organism, different parts of which have different densities. And now our planet, together with the Sun, approaches the site of the galactic route, the energy space of which (the time of this section) is more dense. The beginning of a new phase is evidenced by changes on the planet, growing like a hurricane wave. Therefore, it is impossible to relate the deterioration of the ecological situation exclusively to the economic activity of a person, which certainly brings its negative contribution. And if by means of the laws it is possible to slightly reduce the anthropogenic load on the planetary environments of which we are a part, then the human laws will not affect the changes in the conditions of flight in the Galaxy. We can not change the conditions of flight, but we can change ourselves in such a way as to learn not only to survive in rapidly changing conditions, but also to continue our activity in the field of cognition of the surrounding world and its practical development. Here we are already talking about the distant Cosmos, which will allow us not to depend on the rapidly deteriorating conditions on the planet. But mastering the distant cosmos is a matter of the future, but for now we need to change the usual view of the world and not treat it as an external environment, but feel like its integral part. In other words, one should change consciousness in the direction of expanding its range of perception. Recall that the consciousness of each structure, including man, is the range of vibrations of its energy body. Fractal "Infinity" — it's an infinitely large doll, and the Sun, Earth, man — smaller dolls, invested in the main. Obviously, the management of this economy - the Space of Infinity - must be sufficiently operational so that everything does not crumble. In fact, there must exist forces (energies) in the world that can spread instantly, and these instantaneous signals will already be transferred from structure to structure, where they will manifest sooner or later, depending on the rates of reactions taking place in their material bodies. But while representatives of the official science fiercely deny the very possibility of an instantaneous transfer of information (energy), their unrecognized official opponents - independent researchers (times) - are doing research that allows people to look at the world with a new look that will broaden their consciousness, allowing them to better prepare for future changes.

In the first chapter, we will speak about such outstanding researchers of Time as N.A. Morozov, N.A. Kozyrev, S.E. Shnoll. It is their work that will help us better navigate the rapidly changing world. In fact, their works contain an ancient knowledge of the instantaneous interconnection of everything that exists, repeatedly reflected in fairy tales, myths, and legends of different peoples. If information about long-past events is carefully stored in the memory of different peoples, this means that it has high energy (frequency of vibrations) and density (Time), which allowed it to overcome many layers of past times. However, this information is expressed in a form adopted in those early times and carefully preserved by subsequent generations. But much of what was familiar to our distant ancestors, can be taken in a distorted way or not understood at all. Therefore, this book is mainly based on the works of modern scientists using modern scientific methods, which will allow us to see some ancient immutable truths in the light of the usual ideas for our time. The subtitle of the book — modern science in the light of esoteric representations — means that

there is an inextricable link between the present, the past and the future. Therefore, the views of the Nature of our ancient ancestors will help us on our hard stage of the galactic path - the spiral of the infinite Spiral leading to Infinity.

A little bit about the fractal structure of Time. Of course, the world is much more complicated than an infinite-dimensional doll. But the concept of “fractal” will help to look at the world as an infinite system of structures of different sizes, inextricably linked and reflected in each other: the structure of fractals is in this case a complex-mirror. But do not focus on this: after all, we still can not mechanically recount the infinite number of connections existing in Nature. Here the main thing is the nesting of some structures in others, because of what All depends on Everything. It is interesting that in science the concept of fractal manifested itself on the threshold of future changes in the cosmic (galactic) scale. Just do not hope that the multidimensionality of the World can be calculated with the help of fractal mathematics like calculations in the four-dimensional space of the General Theory of Relativity. Other time — other tasks. But on the work of Shnol should pay special attention to: they have the potential to calculate the repeatability of similar events at different time periods. After all, according to his work, every period is a fragment of the fractal of Time. Investigating the behavior of material structures on periods of different lengths, one can in time learn to “see” the events of the future at once. But this skill will not come as a result of long calculations, but on an intuitive level. And intuition will certainly develop in the future, when the kaleidoscope of various events will change more and more quickly. An indispensable condition for such changes in the perception of the surrounding space is the belief in the existence of an energy (intangible) world vibrating in different ranges. Therefore, expanding the range of perception is the right way to realize oneself as an integral part of the Universe living in accordance with its Laws.

Borissova Larissa, independent researcher
